

ECOFLOW SUCCESS AT

MGM Grand Hotel and Casino

Location

Las Vegas, NV

Highlights

- 6,852 guestrooms
- 4 nightclubs & 19 restaurants

Problem

The hotel's main grease trap system, which consists of 5 - 12,500 gallon in-series traps, was frequently backing up causing foul odors to drift into the private mansion areas of the resort. MGM had not found an adequate solution to this problem and was spending over \$1500/month keeping the traps pumped.

Ecoflow Solution

In 2010 the MGM installed a BIO-Amp™ to help alleviate backup issues at a restaurant grease trap.

Result

After the installation of the initial BIO-Amp on the smaller grease trap, the hotel noticed the odor had significantly decreased as well as the grease build up in the trap. Stemming from the results at the smaller grease trap, the MGM has since added 16 more BIO-Amps throughout most kitchens and in restaurants.

The hotel has not had a significant backup since, and the odors in the mansion area have been eliminated.
